

Sixth Formers' IT Camp Workshop 2004

Introduction to Linux

*He is the mascot of Linux.
His name is Tux.*

Presented by

Adrian S. W. TAM (swtam9@ie.cuhk.edu.hk)

21 July 2004

What is Linux?

- ▶ Developed by Linus Torvalds in 1991.
 - ▶ Linux provides kernel
- ▶ GNU (Free Software Foundation) provides software
- ▶ Combine = GNU/Linux = Complete OS package

Red Hat is not Linux

- ▶ Red Hat is a distribution, not a Linux
- ▶ List of well-known distributions:
 - ▶ Red Hat/Fedora (Most well-known by non-Linuxians)
 - ▶ Mandrake-Linux (Largest in US)
 - ▶ SuSE (Best reputation in Europe)
 - ▶ Debian (Official Distribution of Developers)
 - ▶ Slackware (Grandfather's memory)
 - ▶ Gentoo (Maybe the best distro ever)
 - ▶ LFS (Real player's choice)
- ▶ CD Linux: DemoLinux, Virtual Linux, Knoppix
- ▶ Floppy Linux: floppix, tomsrtbt, Tiny Linux
- ▶ Firewall/Router: gibalder, floppyfw, fli4l

More Linux?

Yopy YP3700

SK Telecom
IMT2000
Cellphone

IBM-Citizen
Workpad

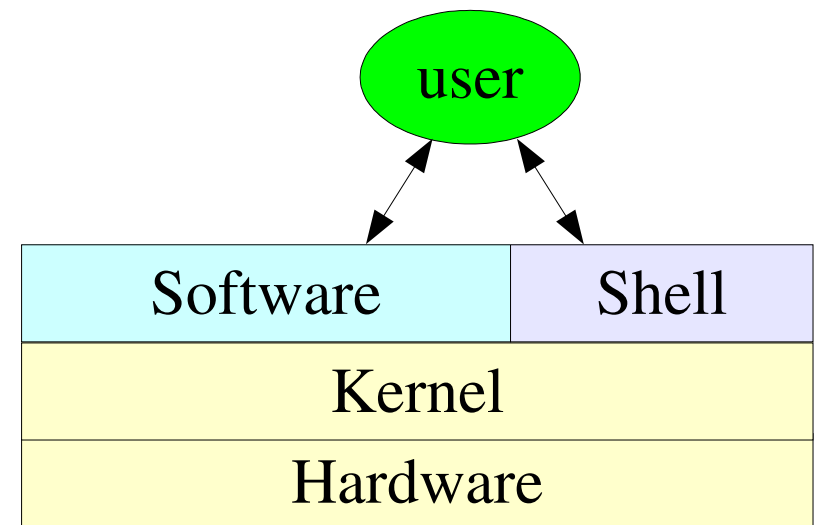

Sharp Zaurus
SL-A3000

Isamu 3

What is Linux?

- ▶ Linux = an OS kernel
 - ▶ Locates between (app.) software and electronics
 - ▶ Process handling (coordination, scheduling)
 - ▶ Error handling (system exceptions)
 - ▶ Hardware interfacing (file system, network, devices)
 - ▶ Memory management (system vs virtual)

What is Linux?

- ▶ OS needs software
 - ▶ User interface (sh, csh, bash, tcsh, ash, zsh, pdksh)
 - ▶ File manipulation (cp, rm, ln, ls, mkdir, cd, rmdir)
 - ▶ Text processing (vi, sed, awk, grep, uniq, sort)
 - ▶ Archiving (zip, rar, arj, tar, bzip2, gzip, cpio, dd)
 - ▶ User management (useradd, usermod, userdel)
 - ▶ Process management (ps, kill, top, nice, renice)
 - ▶ Networking (ftp, wget, telnet, ping, snort, tcpdump)
 - ▶ Programming (gcc, gmake, g++, g77, gcj, gdb)
 - ▶ Automation (cron, at, batch, perl, sh, bg, fg)
 - ▶ GUI (X, xfs, gnome, xfce, kde, mozilla, xfig, lyx, dia, gimp)

What is Linux?

- ▶ GNU/Linux is not FREE!
 - ▶ Money can be charged
 - ▶ Efforts should be paid
- ▶ GNU/Linux is FREE!
 - ▶ Freedom to do everything
 - ▶ Freedom to know everything

Why Linux?

- ▶ Linux is POWERFUL

- ▶ Inherits 40 years' experience from UNIX

- ▶ SCO UnixWare, SCO OpenUNIX, Sun Solaris, IBM AIX, HP-UX, DEC OSF/1, XENIX, Xinu, SGI IRIX, BSDi BSD/OS, Ultrix, Digital Unix, Dynix, Atari Unix, NeXTSTEP, Tru64 Unix, OS/390, Unicos, Darwin, Apple MacOS X

- ▶ FreeBSD, NetBSD, OpenBSD, Dragonfly BSD, GNU Hurd, OSF Mach, OpenDarwin, Minix, BeOS, QNX, AtheOS, AT&T Plan9

- ▶ Couples with UNIX software packages

- ▶ Uses the wonderful design of UNIX

- ▶ Portability, Efficiency, Functionality, Availability, Reliability

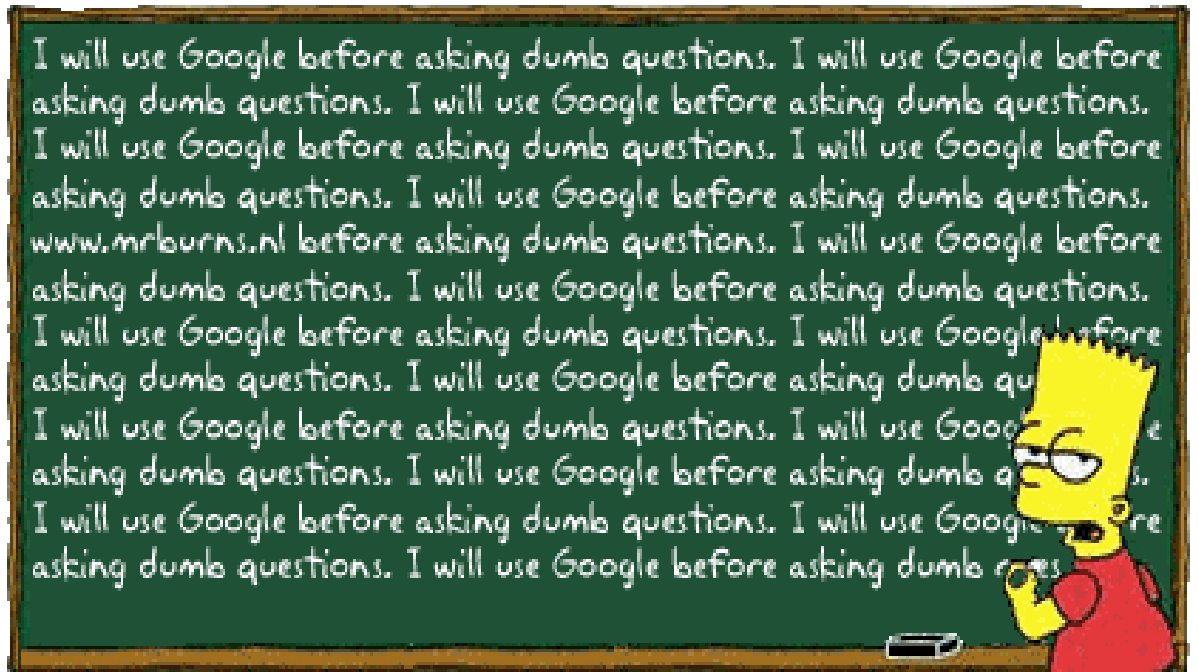

Why not Linux?

- ▶ Linux is not so good
 - ▶ Weak networking
 - ▶ Young
 - ▶ Not unified
 - ▶ Not guaranteed
- ▶ But:
 - ▶ Improving, continuously
 - ▶ Maturing
 - ▶ Linux standard base is available
 - ▶ Community responds quick

Mottos

- ▶ Everything is a file
- ▶ Command line is wonderful
- ▶ Join the building blocks
- ▶ Man is powerful
- ▶ Google is almighty

Installation

- ▶ Detail: During the lab session
- ▶ Where to find Linux?

```
# ncftp ftp.cuhk.edu.hk
Anonymous access granted, restrictions apply.
Logged in to ftp.cuhk.edu.hk.
ncftp / > cd pub/Linux/distributions
ncftp /pub/Linux/distributions > ls -l
drwxr-xr-x  3 ftpadmin itsc          4096   Nov  6  2003  fedora
drwxr-xr-x  3 ftpadmin itsc          4096   Apr 26  2002  gentoo
drwxr-xr-x  3 ftpadmin itsc          4096   Jul 15  09:42  mandrake
drwxr-xr-x  3 ftpadmin itsc          4096   May 27  07:15  redhat
drwxr-xr-x  4 ftpadmin itsc          4096   Jun 30  06:10  slackware
drwxr-xr-x  3 ftpadmin itsc          4096   Jul  2  07:15  suse
ncftp /pub/Linux/distributions >
```

- ▶ **ftp://ftp.cuhk.edu.hk/pub/Linux/distributions**
- ▶ Download and burn a CD, then boot with it to install
 - ▶ Alternatively: use a floppy to do network install

Get Started: Login/Logout

Login

▶ Console Login

```
Debian GNU/Linux stable server1 tty1
```

```
server1 login: root
```

```
Password: XXXXXX
```

```
Last login: Mon Sep 2 09:32:28 2002 on tty1
```

```
Linux server1 2.4.19 #24 Sun Aug 25 20:13:22 HKT 2002 i686 unknown unkn
```

```
server1:~#
```

▶ Secure Shell (SSH) Login

- ▶ SSH: Allows you to securely login to a remote computer

- ▶ Download SSH software

 - ▶ SSH for workstation (<http://www.ssh.com/support/downloads/>)

 - ▶ putty.exe (<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>)

- ▶ In Lab:

 - ▶ Host name: wslinux.ie.cuhk.edu.hk

 - ▶ User ID: std*NN*

 - ▶ Password: newuser

Login (SSH for Workstation)

The image illustrates the steps to log into a remote workstation via SSH. It features three main windows and three dialog boxes:

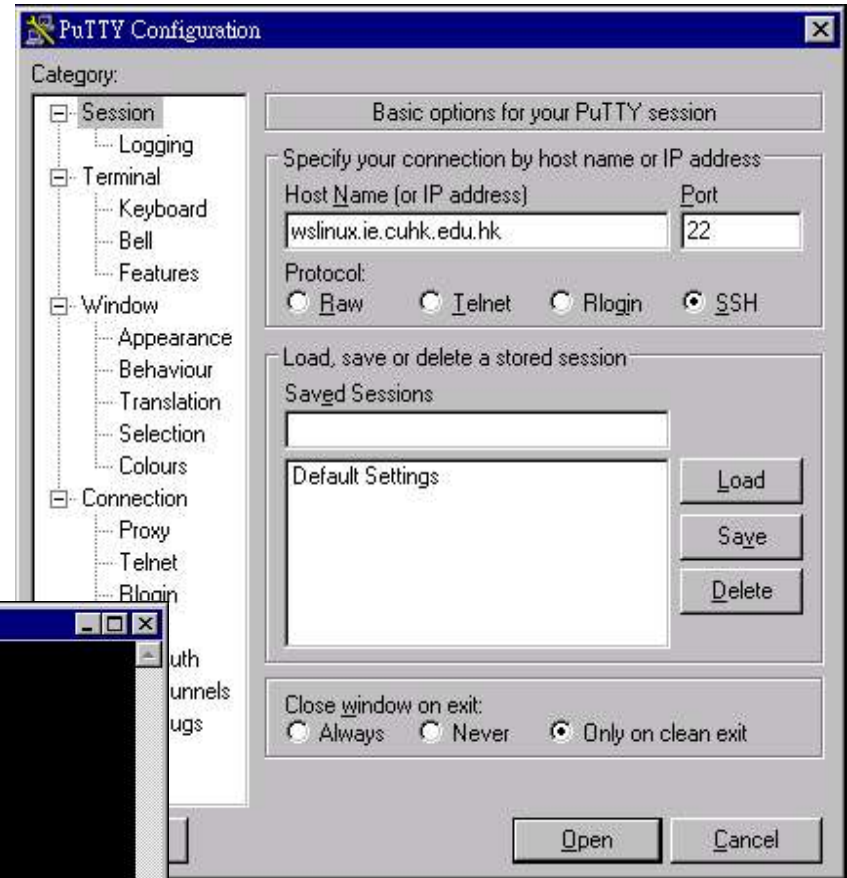

- Top Window:** A terminal window titled "- default - SSH Secure Shell" showing the initial startup text and a "Quick Connect" button highlighted with a red box.
- Middle Window:** A terminal window titled "wslinux.ie.cuhk.edu.hk - default - SSH Secure Shell" showing the output of the 'ls' command. The output lists various system directories and files:

```
[std70@wslinux ~]$ ls  
[std70@wslinux ~]$ ls /  
bin dev home lib misc opt root tftpbboot usr  
boot etc initrd lost+found mnt proc sbin tmp var  
[std70@wslinux ~]$
```

- Bottom Window:** A terminal window titled "wslinux.ie.cuhk.edu.hk" showing the connection status: "Connected to wslinux.ie.cuhk.edu.hk".
- Dialog Boxes:**
 - Connect to Remote Host:** A dialog box with fields for Host Name (wslinux.ie.cuhk.edu.hk), User Name (std70), Port Number (22), and Authentication Method (<Profile Settings>). It has "Connect" and "Cancel" buttons.
 - Enter Password:** A dialog box with a "Password:" field containing "*****" and "OK" and "Cancel" buttons.

Arrows indicate the flow of the process: from the "Quick Connect" button in the top window to the "Connect to Remote Host" dialog, then to the "Enter Password" dialog, and finally to the terminal window showing the successful connection and command execution.

Login (putty)

Logout

- ▶ `exit`
- ▶ Keyboard: `Ctrl-D`
- ▶ `shutdown -h now`
- ▶ `shutdown -r now`

File Hierarchy

File Hierarchy

```
/
|-- bin          binary executables (essential)
|-- boot        boot files
|-- dev         device file system
|-- etc         configuration files, startup scripts
|-- home        home directories of users
|   |-- adrian  home dir. of Adrian
|   |-- brian   home dir. of Brian
|   `-- carson  home dir. of Carson
|-- lib         dynamic linking libraries
|-- misc        miscellaneous (empty)
|-- mnt         mount points
|-- net         network mounts (empty)
|-- opt         optionals (empty)
|-- proc        process file system
|-- root        home dir. of root user
|-- sbin        binary executables for system admin use (essential)
|-- swap        swaps (optional)
|-- tmp         temporaries
|-- usr         (user) static data
|   |-- X11R6   X-Window
|   |-- bin     application executables
|   |-- etc
|   |-- include C/C++ header files
|   |-- lib     C/C++ static linking libraries
|   |-- local
|   |-- man     man pages
|   |-- sbin   application executables for system admin use
|   |-- share  share files (pics, icons, ...)
|   `-- src    source
`-- var        dynamic data
```

File Hierarchy - System

- ▶ **/boot**

Boot files (kernel, System.map, boot loader)

- ▶ **/bin**

Essential binary files (programs)

- ▶ **/sbin**

Essential system binary files

- ▶ **/dev**

Device files resides here

- ▶ **/proc**

Process files resides here

File Hierarchy – Configuration

- ▶ **/etc**

Usually configuration files stores here

- ▶ **/lib**

Dynamic linking libraries, system modules

- ▶ **/tmp**

Temp dir

- ▶ **/var**

Variable data (log files, caches, spools)

- ▶ **/usr**

Static data (C:\Program Files\ ?)

File Hierarchy – User Files

- ▶ **/root**

The home directory of root

- ▶ **/home**

The home directories of other users

- ▶ **/home/adrian**

The home directory of user 'adrian'

File Hierarchy (Further)

- ▶ `/usr/bin`: Not-so-essential binary
- ▶ `/usr/sbin`: Not-so-essential system binary
- ▶ `/usr/lib`: Not-so-essential libraries
- ▶ `/usr/share`: Shared data
- ▶ `/usr/share/doc`: Documentation
- ▶ `/usr/local`: Local data (user-made programs)
- ▶ `/usr/local/bin`: User-made binary programs
- ▶ `/usr/local/sbin`: User-made system binary programs

File Hierarchy (Further)

- ▶ `/var/log`: Log files
- ▶ `/var/cache`: Cache files
- ▶ `/var/spool`: Spools (print spool, etc.)
- ▶ `/var/tmp`: Temp files

File Hierarchy (Summary)

```
/
|-- bin          binary executables (essential)
|-- boot        boot files
|-- dev         device file system
|-- etc         configuration files, startup scripts
|-- home        home directories of users
|   |-- adrian  home dir. of Adrian
|   |-- brian   home dir. of Brian
|   `-- carson  home dir. of Carson
|-- lib         dynamic linking libraries
|-- misc        miscellaneous (empty)
|-- mnt         mount points
|-- net         network mounts (empty)
|-- opt         optionals (empty)
|-- proc        process file system
|-- root        home dir. of root user
|-- sbin        binary executables for system admin use (essential)
|-- swap        swaps (optional)
|-- tmp         temporaries
|-- usr         (user) static data
|   |-- X11R6   X-Window
|   |-- bin     application executables
|   |-- etc
|   |-- include C/C++ header files
|   |-- lib     C/C++ static linking libraries
|   |-- local
|   |-- man     man pages
|   |-- sbin   application executables for system admin use
|   |-- share  share files (pics, icons, ...)
|   `-- src    source
|-- var        dynamic data
```

Important Files

- ▶ `/etc/X11/XF86Config`: XFree86 configuration
- ▶ `/etc/inittab`: init table
- ▶ `/etc/fstab`: mount table
- ▶ `/etc/passwd`: password file
- ▶ `/etc/group`: group assignments
- ▶ `/etc/crontab`: table of cron jobs
- ▶ `/var/log/messages`: Program messages
- ▶ `/var/log/syslog`: System logs
- ▶ `/var/log/auth.log`: Authentication logs

Strange??

- ▶ No 'drive' concept
- ▶ Unified directory tree
- ▶ Different media are connected via a 'mount' process
- ▶ *BSD can use mount to enlarge a storage space!
(Not possible in Linux, yet)

Shell Basics

Shell Basics

- ▶ Root Prompt: #
- ▶ User Prompt: \$

Shell Basics

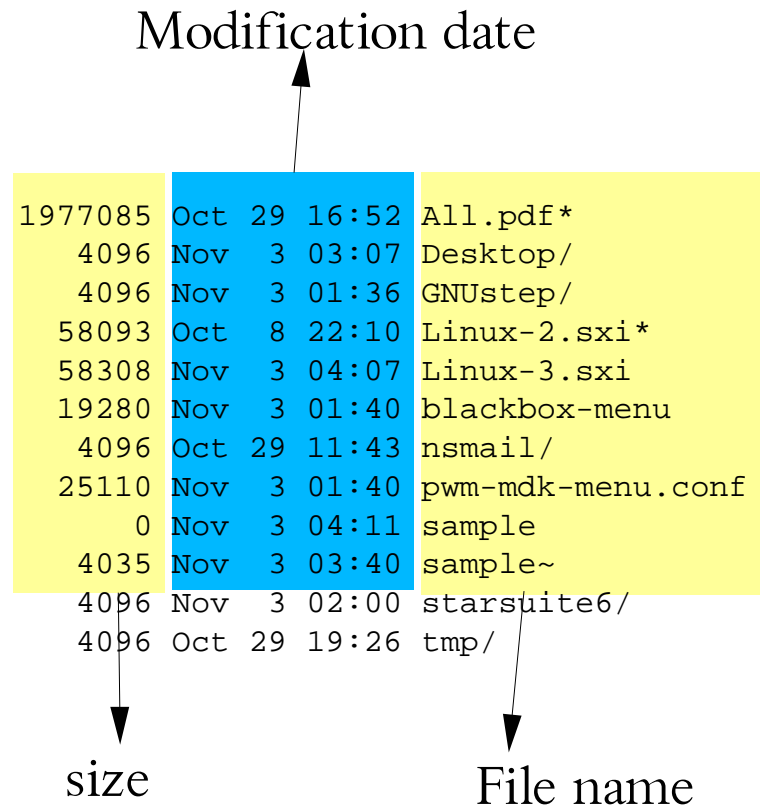

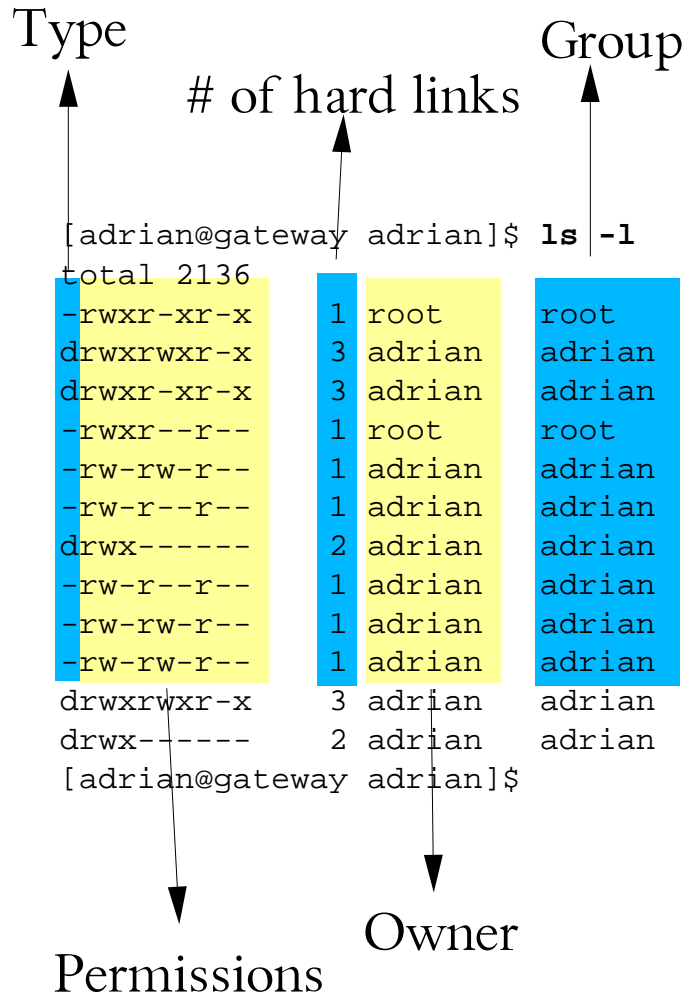

- ▶ Get help:
 - ▶ man
 - ▶ apropos
 - ▶ `/usr/share/doc/*`
 - ▶ Googles

Shell Basics

- ▶ Listing directories: `ls`
 - ▶ Long listing: `ls -l`
 - ▶ Include hidden file: `ls -a`
 - ▶ With color: `ls --color`
 - ▶ With mark: `ls -F`
 - ▶ Recursive: `ls -R`

Shell Basics

File Links

- ▶ Hard Links

- ▶ Two symbols pointed to same *content* in FS
- ▶ Not for directories
- ▶ Forget about it if you don't understand (not so important)

- ▶ Soft Links

- ▶ A symbol pointed to another file
- ▶ Also known as symbolic links
- ▶ It is clear which is the master copy
- ▶ Analogy: 'shortcut' in Windows

File Handling

- ▶ Viewing content = `cat`
- ▶ Viewing by pages = `more / less`
- ▶ Copy files = `cp`
- ▶ Moving files or rename = `mv`
- ▶ Remove files = `rm`
- ▶ Make directory = `mkdir`
- ▶ Change directory = `cd`
- ▶ Remove directory = `rmdir`
- ▶ Create links = `ln`

Nomenclature

- ▶ Directory separator = /
- ▶ Root directory = /
- ▶ Local directory = .
- ▶ Parent directory = ..
- ▶ Home directory = ~
- ▶ Escape character = \
- ▶ Chars to be escaped = {space, \, /, ', ", ` , *, ?, brackets}
- ▶ Names are case-sensitive

Streams

- ▶ Make output to a file
 - ▶ `command > file`
- ▶ Make file as input
 - ▶ `command < file`
- ▶ Make command1's output be command2's input
 - ▶ `command1 | command2`
- ▶ Append output to file
 - ▶ `command >> file`

Streams

- ▶ Make error and output join together
 - ▶ `command 2>&1`
- ▶ Here document
 - ▶ `command << endmark`
- ▶ Command substitution
 - ▶ `command `command1``

Filename expansion

- ▶ Wildcards: * and ?
- ▶ Single character substitution: `ls pic-[abcdefg].jpeg`
- ▶ Single character substitution: `ls pic-[a-gA-G].jpeg`
- ▶ Single character substitution: `ls pic-[^h-z].jpeg`
- ▶ String substitution: `ls pic-{mother,father}.jpeg`

Command-line crazy

- ▶ `echo $((5*4*3*2*1))`
- ▶ `ps aux | grep apache | awk '{print $6;}'`
- ▶ `echo hello | sed -e 's/$/+/'`
- ▶ `echo $((` ps aux | grep apache | awk '{print $6;}' | sed -e 's/$/+/' ; echo 0 `))`
- ▶ `for x in set* ; do cd $x ; for y in *[a-z][0-9] ; do mv $y `echo $y | sed -e "s/^([0-9])\([0-9]\)$/^10\2/"` ; done ; cd .. ; done`

Want more?

- ▶ Find a book and start to learn
- ▶ Come! CUHK has much more interesting things to learn
- ▶ Keep in touch with us!

Thank you very much
